--------------------------------------	--

#### **Reviews and Amendments**

GSMPs are 'living documents' that should be subject to continual review and updating as required. Although the level of attention required will vary considerably depending on the size and complexity of each site, GSMPs should be reviewed at least once per quarter by the GRP. Although it is likely that changes are not required at each review, the date of review and any changes made should be indicated on the tables below. The review of the GSMP will include a site visit to ensure that the site and the content of the GSMP remain valid. The reviews and amendments made will be deleted during the DIO TS three yearly review when the GSMP is re-authorised by the PGE.

Date	Page	Amendment

#### **FORWARD**

MOD, as a gas conveyor within Great Britain, has submitted an Exemplar Gas Safety Case (MOD GSC) to demonstrate compliance with the Gas Safety (Management) Regulations 1996 (GSMR). Maintenance Management Organisations (MMO's) are engaged who have the overall contractual responsibility to operate and maintain the gas network assets under their Contract, including the management of the safe flow of gas within the system and the provision of an emergency service. The MOD delegate specific duties to the MMO but accountability for gas safety on each site rests with the Head of Establishment.

The MOD GSC considers all parts of the MOD estates gas supply system that forms part of the gas supply network. This includes all parts of the MOD estates network from the External Gas Distribution Network (EGDN) connection point to the emergency control valve (ECV) of individual consumers. The MOD GSC considers primarily those matters that relate to the management of the safe flow of gas within the system and the provision of an emergency service.

The conclusions of the assessments within the MOD GSC are:

- There is an adequate safety management system in place to manage the flow of gas safely in its gas supply system.
- Adequate arrangements are in place to comply with the requirements of GSMR and allow co-operation with other bodies that have duties under the regulations.
- Adequate arrangements are in place for ensuring that gas conveyed within the system meets the standards for composition and pressure.
- Adequate arrangements are in place for dealing with reports of gas escapes and investigation of incidents.
- Adequate arrangements have been made to ensure that the risk of a supply failure is minimised.
- Adequate arrangements have been made to ensure that supply emergencies are managed safely.

The MOD GSC is a generic document that outlines the gas safety systems and processes in place for gas networks within the MOD estate. Site-specific details and arrangements are contained within this establishment Gas Safety Management Plan (Section B) (GSMP). As a site-specific component of the MOD GSC, this GSMP has the same legal standing under GSMR.

The layout and structure of this GSMP mirrors that of its parent GSC

Following initial approval by the DIO PGE, the GSM is required to reapprove this GSMP annually. GSMP must be submitted to DIO TS every three years for PGE authorisation.

The HoE and Senior DIO Estate Representative or Equivalent would only be required to re-sign this GSMP annually following the GSM reapproval, unless significant changes to the gas system or a change in one of these key personalities occurs.

GSMP Section A documents detail MOD measures to ensure compliance with the Gas Safety (Installation and Use) Regulations 1998 (GSIUR) for installation pipework (downstream of Emergency Control Valves).

Although the legal status of this document applies in the UK only, the MOD apply the same requirements to the management of natural gas networks on its overseas estate in accordance with the currently published Secretary of State's Health and Safety policy statement.

#### 1 THE DUTY HOLDER AND ESTABLISHMENT LEVEL KEY PERSONALITIES

# 1.1. Gas Safety Case Duty Holder.

The duty holder for the MOD Gas Safety Case is the Permanent Under Secretary for Defence (PUS). However, day to day responsibility for the preparation and maintenance of the document is delegated to the DIO TS Head of Engineering and Construction, who also has the responsibility for managing the system in accordance with the Safety Case. PUS delegates maintenance responsibility to the Top-Level Budget Holders (TLB's), to manage safety of the gas network. The TLB's utilise MOD Contracts i.e. MMOs who have responsibility for maintaining the gas network on behalf of the MOD.

Name: Permanent Under Secretary

Address: Main Building

Horse Guards Parade

Whitehall London SW1A 2HB

# 1.2. DIO Technical Services Principal Gas Engineer (PGE).

The PGE assumes the role of Senior Authorising Authority which is a term used within the MOD to recognise the authority of the person responsible for overseeing the appointment of, and auditing Authorising Engineers (AEs). For Gas the AEs are replaced by Gas Safety Managers (GSMs).

Name: Jeremy Obbard

Address: DIO HQ

2:

Whittington Barracks

Lichfield WS14 9TJ 07748 903260

#### 2 OPERATION UNDERTAKEN

# 2.1 Site Overview.

A brief description of the establishment and its current use. This should include how many separate sites are present, number of buildings being supplied by gas, what the gas is used for and number of personnel who will be affected by a gas outage. Any critical loads should be initial highlighted here (quick reaction forces, large medical facilities, temp controlled ammunition stores etc)

Derriford ARC is a single site establishment with 2 buildings on site. Both buildings are supplied with gas from the Low Pressure (LP) MoD Network.

There are no individual EGDN supplies on site.

The reserve centre is occupied by 264 Headquarters Squadron and the 265 Port Squadron of the 165 Port and Maritime Regiment RLC, C Detachment 243 Field Hospital and Unit 383 Commando Petroleum Troop (V).

Building 1 is used for office space, the caretakers flat, meeting/conference rooms, stores, catering, drills and a lounge/bar.

Building 2 is occupied by the MT section.

Day to Day there are around 20 people on site and there can be up to 200 people on site when there are functions, events or parades.

#### 2.2 Document Centre.

Location of the establishment Gas Document Centre containing all information relating to the gas systems at this establishment (Ref: MOD GSC 10.2) and contact details if different to the GRP.

The Gas document centre is held electronically by VIVO on the sharepoint system

# 2.3 Purpose of Pipeline(s).

A brief description of demarcation agreements between the EGDN, MAM and MOD. Number of MOD networks including operating pressures and number of buildings being supplied direct from the EGDN. End users of gas being supplied such as accommodation, workshops, catering facilities etc.

The gas supply to Derriford ARC is fed from the Wales and West Utilities (WWU) low pressure (LP) network and is a single feed onto site which supplies the site Bulk Fiscal meter.

This in turn feeds the individual MoD Low pressure (LP) network on site at 20.8 mbar which supplies gas to two buildings. (Building 1 and Building 2)

The gas is used for Heating, hot water, and commercial catering.

Building 1 is used for office space, the caretakers flat, meeting/conference rooms, stores, catering, drills and a lounge/bar.

Building 2 is occupied by the MT section.

The MoD is responsible from the meter outlet valve of the bulk fiscal meter up to and including the appliances in the buildings.

#### 2.4 Consumers.

Consumers can be broadly categorised as domestic or industrial / commercial. Gas supplies to domestic consumers are normally prioritised above industrial / commercial consumers.

Domestic consumers supplied from the MOD network:	1 (Caretakers Flat within Building 1)
Industrial / commercial consumers supplied from the MOD network:	2

# 2.5 Description of MOD Gas Networks.

A description of the MOD gas network(s) including location of primary meter(s), twin stream or single stream, primary meter kiosk construction and condition. Pipeline length, material, diameter, pressure, age and condition. Are any PRIs present and number of buildings being supplied?

The gas supply to Derriford ARC is supplied from the Wales and West LP network and enters the site to feed the single stream gas meter within the brick-built standalone meter house at the North-East boundary of the site within the wire.

Bulk Fiscal Meter – Roots Meter Series 4, Model HRD0160B4C

S/N – M0160D768413B7 160 m/3hr MPRN - 3801903

There is a 100mm PE riser entering the brick-built gas meter house and the gas runs through the EGDN ECV and the MAM owned and operated regulator and gas meter.

The MoD's responsibility begins after the gas meter outlet valve. The outlet gas pressure is 20.8 mbar so the MoD network is classed as Low Pressure (LP).

The MoD network is estimated to have been installed in the mid 1990's.

From the 100mm PE entry the gas runs through a 4" control valve and reduces to 3" steel on the valve outlet. After exiting the gas meter the pipework reduces to 2" steel before increasing to 8" steel and dropping into the ground.

The MoD Network then feeds two buildings – Building 1 and Building 2.

# **Building 1**

Building 1 is fed by a single low pressure natural gas supply from the MoD network and the gas enters the building via a 4" below ground steel entry at 20.6 mbar.

The Demarcation point from MoD network to installation pipework is the ECV at the plant room point of entry.

The gas supply then runs through the building to supply the plant room, Kitchen and Caretakers flat.

# **Building 2**

Building 2 is fed by a single low pressure natural gas supply from the MoD network. The gas pipework enters the building below ground and rises from the floor within the plant room. This is in screwed 2" steel.

The Demarcation point from MoD network to installation pipework is the ECV at the plant room point of entry.

The gas runs through the ECV and a solenoid valve and continues in 2" steel to the single boiler. This is the only gas pipework within this building.

The buried section of the MoD network is assumed to be constructed of steel. The total network length is an assumed approximate from site drawings and carrying out trial holes and a leakage survey.

Estimated MoD Network Pipework Length – 147.2 metres

The Network is as per table 2.10

2.6 Primary N	leter Detail	ls.

# 2.10 MOD Network Pipeline Details.

The table below shows the total pipeline lengths for the different pipe diameters and operating pressures

operating pressures.					
	Pressure	Pipe	Pipe	Number of	Total
Network Name / ID	(mbar)	Material	Diameter	Sections	Length (m)
			(mm)		
Network 001	20.8	Steel	100	1	3
Network 001	20.8	Steel	50	1	10.6
Network 001	20.8	Steel	80	1	133.6
Total length of all MOD networks:					147.2
					metres

# 2.11 Network Interconnection.

The outlet pipework system from each of the primary meter installations can be isolated networks or may be interconnected with other MOD systems. For isolated systems turning off the gas supply at a single primary meter installation will shut off supply to all buildings / processes on that pipe system. Interconnected systems will require two or more primary meter installations to be turned off. Figures 2.1 and 2.2 below show the differences.

The MOD pipework system on this e	Isolated	
Supply from Primary Meter Pressure		Can the interconnection be
(Name / ID)	(mbar)	isolated?
None		

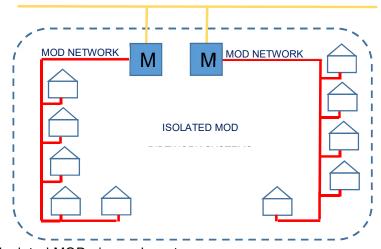

Figure 2.1 – Isolated MOD pipework systems

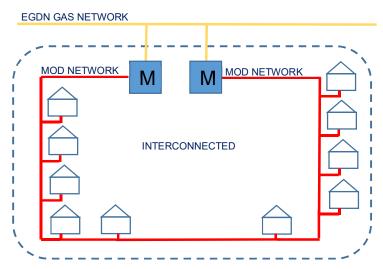

Figure 2.2 – Interconnected MOD pipework systems

#### 2.12 Sensitive and Critical Loads.

The MOD does not have any 'interruptible consumers. Historically large industrial / commercial consumers, who had an alternative fuel supply, could opt to pay a lower rate for an interruptible contract which enabled the supplier to isolate their supply at short notice in order to preserve the gas supply to the public and 'firm contract' industrial consumers in the event of a supply shortage.

However, all industrial and commercial supplies are, effectively, 'interruptible' isolation of these will usually be requested by the supplier in times of supply emergencies in order to preserve domestic supplies for as long as possible.

Where Industrial / commercial consumers have particularly sensitive or critical end users these can be taken into consideration by the EGDN when requesting isolation. Sensitive consumers could include supplies such as a school, medical facility, temperature-controlled ammunition stores etc.

The number of sensitive loads at this					
Facility / Consumers	Supplied from primary meter		Approx. max		
	name	/ ID	throughput (m <sup>3</sup> hr)		
None					
2.13 Standby Alternative fuel Su	pplies.				
Where operational critical supplies are present on site a standby alternative fuel supply should be considered which would enable continued operation in the event of either a local or national supply emergency.					
Facility / Consumers	Supplied from primary meter name / ID	Approx. max throughput (m³ hr)	Alternative fuel supply		
None					

#### 3 PLANT AND PREMISES

# 3.1 Drawings.

The gas layout drawings provide an overview of the gas network and the interfaces(s) with the EGDNs network.

The layout drawings should detail:

- a) The site boundaries.
- b) The primary meter installations.
- c) Secondary PRIs.
- d) Valve locations.
- e) Pipeline routes, diameters, material and depth.
- f) Operating pressure tier.
- g) Demarcations
- h) Responsibilities (EGDN / MOD)

The layout drawings are located at Annex B either embed as a PDF or hard copies. The drawings will be subject to the GRP quarterly review and following any physical changes or system updates. Hard copies of the drawings are located in the gas document centre.

# 3.3 Responsibility Interfaces and Access Arrangements.

For gas incidents or maintenance that affect the EGDN, the EGDN representative will become the network emergency controller. The EGDN establishment direct contact will be the GRP who will make all relevant arrangements for access to the primary meter(s) and plant room access (for emergency isolation etc).

As the MOD establishments are high security, all EGDN personnel who attend for gas supply emergencies or to carry out maintenance work will be granted access to site on an individual basis.

All EGDN personnel attending this establishment will be subject to site specific security procedures and will be required to be escorted whilst on site, access and escorting may vary depending on the nature of the visit, time of incident etc.

Below are the site-specific arrangements in place to allow the EGDN access during an emergency, as agreed by the HOE:

No Guardroom on site – Working Hours Contact: 01752 835800 Out of Hours Contact: Wessex RFCA 01823 254571

# 4. OPERATION AND MAINTENANCE DOCUMENTATION

# 4.1 MOD Network Maintenance.

Network maintenance is mandated in GSMR and all network maintenance requirements and tasks on MOD establishments are detailed in the MOD Gas Network Technical Standard TS/GAS-01. TS/GAS-01 has been written in line with legislation, industry standards and guidelines.

The testing, inspecting and maintenance frequencies vary depending on the task, the table below shows the intervals at which it should be conducted and the date the tasks have been complete.

# 4.2 Iron Pipework.

Where cast iron (including spun iron) or ductile iron pipework exists on an MOD establishment it is to be risk assessed in accordance with section 4.3 of the MOD GSC and, where required, entered into a mains replacement programme in order to comply with the UK mains replacement enforcement policy.

Below is the amount of Cast Iron and / or Ductile Iron pipe, and details, identified at this establishment from a survey:

Cast Iron (	m):	Not Applicable				
Ductile Iro	n (m):

(mbar)	Diameter	Ductile Iron	Length	Proximity to	Score	Replacement
	(")		(m)	buildings (m)		Date

#### 5. RISK ASSESSMENTS

#### 5.1 Model Risk Assessments.

The Model Risk Assessment (RA) shown in the table below, highlight the factors that will affect the safe management of the flow of gas, and the provision of the emergency response service. These RA, reviewed and modified as appropriate to this establishment, are shown at Annex C. (These RA must be reviewed and authorised by the GRP as being correct for this establishment with the date entered at the top of the RA).

RA No.	Title (Model Risk Assessments)
1	Any gas leak considered hazardous to persons or property (Under med/low pressure conditions).
2	Fire or explosion near to, or directly involving, a pipeline or gas facility.
3	A failure of operation of pipeline/plant onsite, or immediately downstream of site, that is maintained by the gas transporter.
4	A failure of operation of pipeline/plant onsite that is maintained by site services.
5	Failure of safety critical equipment.
6	Under-pressure in the gas system.
7	Over-pressure in the gas system.
8	Failure in system during load shedding.
9	General changes to the gas network.
10	Failure of PPM, general operation of the gas network plant/equipment and safety inspections.
11	Emergency Shutdowns.
12	Interface with Gas Transporter.
13	Interface with the consumers.
14	Interface with Emergency Services.
15	Natural Disasters, civil disturbances, other unforeseen events.

# 5.2 Additional Site-Specific Risk Assessments.

In addition to the model RA shown above, the site-specific RAs shown below have been identified. These RA are shown in Annex D (As with the Model RAs above, these must be reviewed and authorised by the GRP as being correct for this establishment with the date entered at the top of the RA).

16	Buildings with steel tails on the service entries
17	Shallow services
18	
19	

#### 6. SAFETY MANAGEMENT SYSTEMS

No site-specific considerations (refer to MOD Gas Safety Case Section 6) unless stated below:

Network maintenance was last undertaken by DNV on 22/02/2022. Provision of future network maintenance has not been procured by EA RFCA at this time.

# 7. EMPLOYEE COMPETENCE

No site-specific considerations (refer to MOD Gas Safety Case Section 7) unless stated below:

No site-specific considerations confirmed

#### 8. CONTRACTORS

No site-specific considerations (refer to MOD Gas Safety Case Section 8) unless stated below:

No site-specific considerations confirmed

# 9. HEALTH AND SAFETY COMMUNICATION - INTERNAL

#### 9.1 Health and Safety Communication

This section describes the systems in place to enable effective communications within this establishment. Different forms of communication are used to pass information to people within the MOD/MMOs depending on the type of information and the audience including in the event of an emergency.

# 9.1.1 Public Address System.

The public address arrangements for this establishment are shown below

There is no public address system on site

# 9.1.2 Internal Electronic Correspondence.

Details of any internal email or intranet correspondence are shown below

The site has the facility for email to be used for communication. Email addresses for Key site personalities are listed in section 1 of this document.

#### 9.1.3 Direct Contact.

Details of any site-specific arrangements for direct MOD / MMO contact with site personnel and families are shown below

Face to face meetings with key personnel are possible on a regular basis if required.

# 9.1.4 Emergency Plans.

Details of any site-wide emergency plans and arrangements, including MMO documents are shown below

No specific gas emergency plan for the establishment is in place. MOD Exemplar Gas Safety Case to be used as guidance.

# 9.1.5 On-Site Emergency Services.

Details of site-specific arrangements for communication with site emergency services, such as fire, are shown below

There are no on-site emergency services. Site personnel will dial 999 for Police, Fire and Emergency Medical services.

Procedure for an incident involving the gas installations on site:

- Call Vivo Helpdesk Team on <u>0800 030 9320</u> open 24 hours per day.
- The Helpdesk will in turn call National Grid <u>0800 111 999</u> to attend and make safe a gas incident.
- The Vivo Gas Responsible Person shall be informed immediately by the site personnel.

# 10. HEALTH AND SAFETY COMMUNICATION - EXTERNAL

No site-specific considerations (refer to MOD Gas Safety Case Section 10) unless stated below:

No site-specific considerations confirmed

#### 11. AUDITS

#### 11.1 GSM Audit.

The audit process in place monitors and measures compliance with legislation and company policy and is aimed at ensuring the safe flow of gas within the MOD networks and downstream of the consumers ECV.

The GSM audit role is primarily concerned with assuring that the GRP duties are being effectively undertaken and that the gas risks are being effectively managed on the site. All GSM Audits will be carried out using the standard audit template prepared by the DIO PGE. Every site with gas networks shall be audited as frequently as practicable, ideally annually and in accordance with a programme agreed with the DIO PGE. Every site shall be audited at least once every three years. Each GSM shall implement an audit programme which must be agreed by the DIO PGE. All completed audit reports shall be sent to the DIO PGE for review and filing.

As agreed with the PGE, GSM audits on this establishment will be carried out:	On a three-yearly basis
The last GSM audit was conducted on:	28/11/2024
The last GSM audit was carried out by:	Neville King
The qualitive assessment of the GSM audit concluded this establishment is: (safe to continue / safe to continue subject to caveats / unsafe to continue)	Safe to continue subject to Caveats
Audit findings:	See GSM Report
Points addressed following last audit:	

#### 12. CO-OPERATION

# 12.1 Emergency Exercises.

On MOD networks, the MMO utilises EGDN to provide a gas emergency response service for dealing with reported gas escapes. However, the EGDN response would normally be to isolate MOD supplies at the incoming meter installation(s). As this is likely to cause considerable inconvenience and expense to MOD facilities, where possible MMO staff / contractors would attempt to attend the emergency in advance of the EGDN personnel to assess the emergency and advise EGDN accordingly.

It is the responsibility of the HoE to ensure that a gas emergency exercise is conducted on the establishment at least once in a three-year period. The HoE will require the support and involvement of the MMO and all key stakeholders such as the EGDN. Lessons learnt should be actioned and kept within the gas document centre.

Date of last emergency exercise:	No previous emergency exercises -
	Requirement for emergency exercises has
	been issued to the RFCA for distribution to
	HoE's, not currently planned in for completion.
Date of next planned emergency exercise:	From Q4 2023
Date of last actual emergency involving EGDN:	No previous actual emergency reporting
Were the EGDN involved in the last	
emergency exercise:	
Were the MOD emergency services	
involved in the last emergency exercise or	
actual emergency:	
Summary of lessons learnt from the last	
emergency exercise or actual emergency:	
Date MMO emergency contact numbers	
and procedures were last tested:	

# 13. EMERGENCY SERVICE RESPONSE TO GAS ESCAPES

No site-specific considerations (refer to MOD Gas Safety Case Section 13) unless stated below:

Procedure for an incident involving the gas installations on site:

- Call Vivo Helpdesk Team on 0800 030 9320 open 24 hours per day.
- The Helpdesk will in turn call National Grid <u>0800 111 999</u> to attend and make safe a gas incident.
- The Vivo Gas Responsible Person shall be informed immediately by the site personnel.

# 14. INVESTIGATIONS

No site-specific considerations (refer to MOD Gas Safety Case Section 14) unless stated below:

No site-specific considerations confirmed

# 15. GAS QUALITY

No site-specific considerations (refer to MOD Gas Safety Case Section 15) unless stated below:

No site-specific considerations confirmed

# 16. CONTINUITY OF SUPPLY

No site-specific considerations (refer to MOD Gas Safety Case Section 16) unless stated below:

No site-specific considerations confirmed

#### 17. ADEQUATE NETWORK PRESSURE

# 17.1 Network Analysis.

Network Analysis is the primary tool by which the MOD satisfies itself that anticipated levels of demand can be supplied from its MP and LP networks to gas consumers. It allows different scenarios to be examined. The technique ensures the efficient management and operation of the MP and LP gas supply systems. It enables a detailed understanding of the gas supply system to be developed upon which cost effective planning and operating decisions can be made.

In accordance with industry recommendations Network Analyses must be repeated at every site containing an MOD Network at least five-yearly, or sooner, if for gas system modification purposes or when demand profiles have changed, or are expected to change.

parposes of this assistant promos have strainged, or an expected to charinge.			
For this establishment the network analysis was undertaken by:	DNV		
For this establishment the network analysis was undertaken on:	03/08/2022		

# 17.2 Design Minimum Pressure.

The MOD utilises nominal minimum design pressures, in compliance with IGE/GL/1. These minimum pressures will be seen at the extremities of the systems under extreme conditions. To ensure that all gas equipment downstream of the meter can be safely operated, it is a gas industry recommendation that the network should maintain a minimum of 20.75 mbar at the end of any service pipe. However, for existing networks, it is permitted to have a pressure as low as 19 mbar at the end of any service under 1 in 20 peak six-minute conditions. This value must also include any temporary contingencies to support maintenance activities. Where any appliances have elevated minimum recommended operating pressures ( $P_{ign}$ ), the DmP must allow for this, taking into account any pressure losses across the meter (4mbar) and through installation pipework (10% of  $P_{ign}$ ).

The minimum modelled pressure (based on	19.1 mbar
1:20 peak 6 minutes flow conditions) at the	
outlet of the consumers ECV at the system	
extremity is:	
The location of the minimum pressure is:	Building 1
The declared minimum pressure (DmP) is:	19 mbar

# 17.3 Network Analysis Results.

A brief description of the network analysis results is below:

The pipe data available at the time of producing this report, and which has been used to build the Synergi network analysis model of Derriford ARC, was of a good quality. Demands were estimated based upon appliance ratings determined during the site survey.

The BFPM has a larger capacity than the calculated maximum demand and is therefore adequately sized.

There is a good degree of confidence in the pressures predicted by the network model based on the comparison with recorded pressures.

Modelling of the documented infrastructure and maximum estimated gas demands shows that all the buildings modelled should receive gas with a pressure above the minimum limit of 19 mbarg within the network.

# 17.4 Network Validation Survey.

As part of the network analysis validation procedure, pressure monitoring points are to be installed on MOD networks to enable pressure surveys to be conducted. In accordance with the recommendations of Section 8.3.2. of IGE/GL/1, pressure surveys will need to be carried out on MOD networks to verify that the results from the network models were indicative of the recorded pressures on the network. This is a practice which is widely used throughout the gas industry to check network models provide realistic results.

It is the responsibility of the MMO to ensure adequate pressure surveys are conducted at regular intervals to validate the pressures predicted by network analysis results. This must be conducted at a minimum of once every five years, in conjunction with a Network Analysis or when demand profiles on the network have changed. Similarly, if the results of a previous Network Analysis are suspected to be inaccurate (for example, low extremity pressures being experienced), a repeat Network Analysis should be undertaken.

For this establishment the latest validation survey was undertaken by:	DNV
For this establishment the latest validation	22/02/2022
survey was undertaken on:	

# 17.5 Network Validation Survey Results.

A brief description of the network validation survey results is below which includes a comparison of the modelled pressure and actual pressure record;

In accordance with the recommendations of Section 8.3.2 of IGE/GL/1, a pressure survey would normally be carried out on the Derriford ARC network in order to verify that the results from the network model were indicative of the recorded pressures on the network. This is a practice which is widely used throughout the gas industry to provide confidence in network analysis models.

The network was surveyed on the 22nd February 2022. Single point pressure readings using a Druck pressure gauge or similar were recorded. These were attached to the outlet of the supply regulators and at the appliances in the buildings.

A simple pressure survey of short-term single readings were undertaken at 2 appliances and the BFPM outlet within the modelled area. The recorded pressures taken in this type of survey may be standing pressures where the appliances are not operational, or working pressures, where they are. There may be several mbarg difference between these pressures.

Gas is supplied to Derriford ARC from a low pressure (LP) main. Supply pressure data obtained by DNV in the form of instantaneous pressure readings shows the outlet pressure of the main site regulators to be as follows:

Network 01 Bulk Fiscal Primary Meter (BFPM), located in the Meter House had an outlet pressure of 20.8 mbarg (working).

This instantaneous pressure recorded at these meters has been used as the model operating pressure.

Building	Modelled Flow (sm³/h)	Pressure (mbarg)	
Dullullig		Single Read	Modelled
Meter House (BFPM)	61.1	20.8 (working)	20.8
Building 1 – Offices, Kitchen, Drills Halls	41.2	20.4 (working)	19.1
Building 2 – MT Workshops	19.9	20.5 (working)	20.3

All of the modelled pressures are similar to the recorded pressures as expected.

As a result of the pressure comparison, there is a high level of confidence in the modelling of the network.

The modelled network supplies each demand with gas above the minimum pressures of 19 mbarg.

The minimum modelled pressure is 19.1 mbarg at the inlet to the Building 01. This shows a modelled pressure drop of 1.7 mbarg from the supply (20.8 mbarg).

#### 17.6 Corrective measures.

Following the network analysis and network validation survey the below corrective or mitigation measures have been planned at this establishment;

MOD network name / ID:

MoD Network 01

The results for the Derriford ARC model as a whole are satisfactory.

# 18. GAS SUPPLY EMERGENCIES

No site-specific considerations (refer to MOD Gas Safety Case Section 18) unless stated below:

No site-specific considerations confirmed

#### GAS QUALITY – SOLE CONVEYER

No site-specific considerations (refer to MOD Gas Safety Case Section 19) unless stated below:

No site-specific considerations confirmed

#### 20. DISCONTINUING GAS SUPPLY

No site-specific considerations (refer to MOD Gas Safety Case Section 20) unless stated below:

No site-specific considerations confirmed

# 21. RESTORATION OF SUPPLIES

No site-specific considerations (refer to MOD Gas Safety Case Section 21) unless stated below:

No site-specific considerations confirmed

Site Reviewed Model Risk Assessment - 01		
For: Derriford ARC  Approved by: Wayne Ashford		
Any gas leak considered hazardous to persons or property  Date reviewed: 07/04/2025		
Risk	Any leak at any pressure can be quantified as a hazard. The higher the pressure and/or depending on the location of the leak the risk to the surrounding area varies  Depending on the severity of the leak, other hazards such as explosions, fires, supply failures, pollution and associated financial implications could arise  Depending on how quickly & thoroughly the gas leak is dealt with the resulting hazards from the incident will vary.	
Caused By	Damage to pipelines from digging Failure of control equipment Damage caused by general construction Corrosion of pipelines Failure of mechanical joints and seals Deterioration or rupture of pipeline Poor communication between involved parties can exacerbate the problem Length of response time by first responders	
Hazards Resulting from Risk	Damage to pipelines caused by uncontrolled escaping gas Risk of causing a supply emergency Damage to persons & property Risk of Explosions & Fire Pollution of environment Purging maybe required after corrective action	
Current Preventative Methods	Permits to Dig  Planned Preventative Maintenance  Type & Quality control of materials used in gas network  Strict adherence to emergency procedures in the event of an emergency  Isolation via emergency stops  Installation of gas network to industry standards	
Further Required Preventative Methods	Pressure monitoring  More accurate gas network layout drawings  Use of the gas safety management plan  Training of all involved parties  Training and simulated gas emergency drills	
Audits	In the event of an incident, near miss or any other hazardou must be reviewed and updated as appropriate.	is occurrence this RA

	Emergency Shutdowns	
Risk	Emergency shutdowns can be used in the event of a gas incident which warrants the gas network or part thereof to be shut down. If this process fails, it can have a severe impact on the resolution of the incident	
Caused By	Failure of emergency shutdown valves Ageing emergency shutdown valves Lack of sufficient facilities for segregated shutdowns	
Hazards Resulting from Risk	Escalating hazard cause by existing emergency Damage to pipelines and gas network plant and equipment Risk of causing a supply emergency Long down time	
Current Preventative Methods	Management of gas infrastructure and adherence to Gas safety Case and Gas Safety Management Plans Use of site gas layout drawings	
Further Required Preventative Methods	Providing strategically placed emergency shutoff valves Scheduled PPM Checking credentials of design authority for gas network Replacing old equipment where required	redesign
Audits	In the event of an incident, near miss or any other hazard must be reviewed and updated as appropriate.	dous occurrence this RA

Site Reviewed Model Risk Assessment - 12		
		Approved by: Wayne Ashford
	Interface with Gas Transporter	
Risk	If interfaces between the site team and the gas transporter carefully, the fallout from gas incidents can become more p	•
Caused By	Poor response time by EGDN  Poor communication between onsite parties and EGDN  Poor coordination of onsite parties and EGDN  Poor communication of procedures	
Hazards Resulting from Risk	Damage to pipelines Resultant hazards from any gas incident can escalate Risk of causing a supply emergency Damage to persons & property Risk of Explosions & Fire	
Current Preventative Methods	Usage of DNV gas emergency number to allow communica and EGDN	tion between DNV RP
Further Required Preventative Methods	Communication of site procedures to EGDN Understanding EGDN procedures Training and simulated gas emergency drills Regular communication through fixed procedures	
Audits	In the event of an incident, near miss or any other hazardou must be reviewed and updated as appropriate.	s occurrence this RA

Site Reviewed Model Risk Assessment - 13				
For: Derriford ARC		Approved by: Wayne Ashford		
Interface with Consumer		Date reviewed: 07/04/2025		
Risk	If communication between the site team and the end user are not carefully established, the fallout from gas shortages could result in the system having to be purged and the pilot lights re-ignited. On a large site such as this, it could take up to three days to re-ignite all pilot lights.			
Caused By	Poor communication  Lack of understanding  No method of checking on gas usage			
Hazards Resulting from Risk	Risk of causing a supply emergency Loss of pressure in system Long recovery period Potential for air in the gas network			
Current Preventative Methods	Regular site visits and communications with site staff Usage of DNV gas emergency number to allow communica and site if gas incident is called in	tion between DNV RP		
Further Required Preventative Methods	Pressure monitoring system Use of the Gas Safety Management Plan			
Audits	In the event of an incident, near miss or any other hazardou must be reviewed and updated as appropriate.	is occurrence this RA

Interface with Emergency Services		Date reviewed: 07/04/2025		
Risk	The first responder has a duty to minimise the risk to the surrounding area upon arrival. If the gas incident is within an enclosed area, isolating the system is the correct course of action. However, in a open, well ventilated area, isolating the system may not be necessary, and could cause secondary hazards			
Caused By	Poor communication  Lack of understanding			
Hazards Resulting from Risk	Risk of causing a supply emergency Causing the need to purge systems Long downtime of gas network			
Current Preventative Methods	Usage of DNV gas emergency number to allow commun RP and Emergency services if a gas incident is called in			
Further Required Preventative Methods	Providing training to the Emergency Services, so that the tackle gas incidents	ey will be able to better		
Audits	In the event of an incident, near miss or any other hazar RA must be reviewed and updated as appropriate.	dous occurrence this

Natural Disasters, civil disturbances, other unforeseeable events		Date reviewed: 07/04/2025	
Risk	The risk of unforeseeable events causing gas related incidents cannot be planned for. However, it is possible to minimise the impact of the resulting hazards		
Caused By	Explosions Ground tremors Gas pipe sabotage		
Hazards Resulting from Risk	Damage to pipelines caused by uncontrolled escaping gas Risk of causing a supply emergency Damage to persons & property Risk of Explosions & Fire Pollution of environment Purging maybe required after corrective action		
Current Preventative Methods	High security levels		
Further Required Preventative Methods	Use of the Gas Safety Management Plan		
Audits	In the event of an incident, near miss or any other hazar must be reviewed and updated as appropriate.	rdous occurrence this RA	

## **ANNEX D**

## ANNEX D - ADDITIONAL SITE-SPECIFIC RISK ASSESSMENT TEMPLATE

Additional Site-specific Risk Assessment 16				
For: Derriford ARC		Approved by: Wayne Ashford		
Buildings with steel tails on the service entries		Date reviewed: 07/04/2025		
Risk	Uncontrolled gas escape			
Caused By	Corrosion of steel tails  Failure of vulnerable pipework as a result of third party interference			
Hazards Resulting from Risk	Loss of gas supply Long recovery period Re-commissioning & purging after corrective action Re-ignition of non-automatic ignition systems Damage to persons & property Risk of Explosions & Fire Pollution of environment			
Current Preventative Methods	Over line and leakage surveys Installation of gas network to industry standards Type & Quality control of materials used in gas network Strict adherence to emergency procedures in the event of an emergency			
Further Required Preventative Methods	Vulnerable pipework surveys and corrective actions Replacement of steel tails where required and when other r infrastructure are taking place	modifications of the		
Audits	In the event of an incident, near miss or any other hazardou must be reviewed and updated as appropriate.	us occurrence this RA
